

Fedora Kernel Rollback Guide

This guide explains how to roll back to a working kernel if a new kernel or kernel module breaks your system.

Booting to an Older Kernel

1. Reboot your system:

```
sudo reboot
```

2. At startup, press ``Esc`` (or hold ``Shift``) after the BIOS logo to open the GRUB menu.

3. Select ****Advanced options for Fedora****.

4. Choose an older kernel (e.g., 6.14.x).

5. Boot normally. Confirm version:

```
uname -r
```

Removing a Broken Kernel

1. List installed kernels:

```
rpm -q kernel-core
```

2. Remove the broken version:

```
sudo dnf remove kernel-core-
```

Make Stable Kernel Default

Replace `` with output from `uname -r`:

```
sudo grubby --set-default /boot/vmlinuz-
```

Lock Kernel Updates Temporarily

```
sudo dnf versionlock add kernel
```

Summary

- Fedora keeps multiple kernels by default.
- Always roll back by selecting an older kernel in GRUB.

- Use this guide to remove bad kernels and set the stable one as default.
